

Audit Passport Summary

Rule readiness score: 66/100

PyMC readiness probability: 33% (90% CI 12%-58%)

Based on recalled findings, multiple data integrity exceptions are open in the dataset (track01_data_rescue.csv) that may weaken audit readiness. The most acute issue is a hard chronology breach (shipping occurring before production), which directly undermines cutoff assertions and traceability and is likely to be treated as an audit blocker until resolved. Additional high-severity risks include negative quantities in manufactured inventory records and conflicting quantities across records for the same entity, both of which can impact inventory valuation and downstream financial reporting. Master-data integrity is also impaired where customer IDs referenced in transactions do not exist in the customer master (track01_customers.csv). Medium-severity issues relate to potential near-duplicate signatures (double-count risk requiring confirmation) and ambiguous unit/quantity semantics (e.g., "mm"), which is primarily a definition/control design issue but may affect reporting accuracy.

No remediation decisions or patches were recalled for these items; all findings are currently open and flagged for triage.

Top Audit Passports

F-DC-002 | Critical | Risk 95 | Audit finding

Affected:

Why it matters:

Action: Pending triage. Ship date preceding production date is a hard chronology breach with direct cutoff/revenue/inventory timing implications. There is no safe deterministic correction without a trusted source-of-truth date lineage (ERP/WMS/BOL).

Evidence: track01_data_rescue.csv row 48, ship_date=2024-10-29

Evidence: track01_data_rescue.csv row 465, ship_date=2025-12-29

Evidence: track01_data_rescue.csv row 1405, ship_date=2025-12-09

F-DC-003 | High | Risk 90 | Audit finding

Affected:

Why it matters:

Action: Pending triage. Negative quantities may indicate legitimate adjustments (returns/scrap/reversals) versus data corruption. Auto-flipping signs would be non-auditable without transaction-type semantics.

Evidence: track01_data_rescue.csv row 939, quantity=-445

Evidence: track01_data_rescue.csv row 2563, quantity=-164

Evidence: track01_data_rescue.csv row 3823, quantity=-32

F-DC-005 | High | Risk 88 | Audit finding

Affected:

Why it matters:

Action: Pending triage. Conflicting quantities for the same entity across records requires identification of the authoritative version (versioning/change control). Without an explicit rule (latest timestamp, status, revision id), automated selection risks misstating inventory.

Evidence: track01_data_rescue.csv row 3, quantity=592

Evidence: track01_data_rescue.csv row 4, quantity=826

Evidence: track01_data_rescue.csv row 7, quantity=4137

F-DC-001 | High | Risk 80 | Audit finding

Affected:

Why it matters:

Action: Pending triage. Customer IDs referenced in transactions but missing from the customer master indicate master-data

completeness/control failure. A controlled master reconciliation can resolve this, but creating customers blindly is not a safe auto-fix.

Evidence: track01_data_rescue.csv row 3, customer_id=CX-A228

Evidence: track01_data_rescue.csv row 51, customer_id=CX-G153

Evidence: track01_data_rescue.csv row 87, customer_id=CX-E185

F-DC-006 | Medium | Risk 70 | Audit finding

Affected:

Why it matters:

Action: Pending triage. Potential duplicate row signatures can cause double-counting, but the finding notes possible detection/signature ambiguity. Requires confirmation of true duplicates before any deletion/merge.

Evidence: track01_data_rescue.csv row 26, record_id=R-00025

Evidence: track01_data_rescue.csv row 40, record_id=R-00039

Evidence: track01_data_rescue.csv row 46, record_id=R-00045

F-DC-004 | Medium | Risk 62 | Audit finding

Affected:

Why it matters:

Action: Pending triage. Quantity paired with physical measurement units (e.g., mm) indicates a data-definition/modeling ambiguity (count vs measurement). This is a schema/semantics issue and cannot be safely auto-corrected without business definitions.

Evidence: track01_data_rescue.csv row 2, unit=mm

Evidence: track01_data_rescue.csv row 3, unit=mm

Evidence: track01_data_rescue.csv row 4, unit=mm

Sign-off Note

This report is generated from semantic memory cards, evidence pointers, and agent handoffs. Manual review remains required for unresolved audit blockers.
